

Yorkuni Leisure Group (YULG) has recently suffered a malware outbreak which resulted in significant harm to their internal systems. Due to a lack of preparedness, they were unable to respond to the incident in a way which allowed them to identify the nature of the attack, and the possible attacker. As a result, their insurers have informed the Board of Directors that they intend to withdraw the company's Cyber-Incident cover until a complete Incident Response plan has been produced. You have been tasked with preparing the Forensic Response part of that plan.

The company has 20 staff, including directors, who work in the HQ building. Each is provided with a Windows laptop, which they can take away from HQ when necessary, and a wired network connection to their desk. There is a central server, running a RAID-5 array, which contains important business files and databases. Each user has their own account and directory on the server. The office network is protected by an inbound firewall device which connects to the router. The company also has a cloud-based web server which has limited access to the database at HQ for updating orders and querying stock levels.

Your plan, therefore, should include details of pre-incident preparation that the company can carry out, as well as outlining correct actions to take, in the event of another incident, in order to maximise the potential digital evidence available for further investigation.
